CAREER OBJECTIVE

Aspiring Cloud and DevOps Engineer with hands-on experience in AWS, Terraform, GitHub, Linux, and CI/CD pipelines. Seeking an opportunity to apply technical skills while contributing to the development of scalable cloud solutions.

SKILLS

Languages: Java, Python (Basic)

Technologies: Linux, Git, React.js, GitHub

Cloud Computing: AWS (EC2, S3, IAM, RDS, VPC, Lambda, Route 53, CloudFront, ECS, ECR), Terraform, GitHub Actions, CI/CD, SonarQube, Nexus, Tomcat, Docker.

PROJECTS

Web Projects

These are a few projects that I developed during my web development learning journey:

- Hospital Management System (React.js, PHP, MySQL, XAMPP)
- ERP System (React.js, Node.js, PHP, MySQL, XAMPP)

Smart Delivery Box Project

Developed an IoT-based Smart Delivery Box using NodeMCU ESP8266 to provide secure and automated parcel storage, preventing theft and enabling last-mile deliveries when the recipient is away.

AWS Cloud Computing Projects: (VCube Software Solutions)

PROJECT – 1

Title: 3-Tier Architecture Deployment on AWS Overview:

- Designed a 3-Tier Architecture (Presentation, Application, Database) to improve scalability, security, and manageability.
- Implemented a highly available and secure AWS setup using core cloud services as part of hands-on practice.

AWS Services Used:

- VPC – 6 subnets, Internet Gateway, NAT Gateway, and route tables
- EC2 – Web and application servers
- Elastic Load Balancer (ELB) – Traffic distribution
- AMI – Reusable instance images
- Auto Scaling – Launch Templates and Auto Scaling Groups
- RDS (MySQL) – Database with automated backups

PROJECT – 2

Title: CI/CD Pipeline for Java Web Application using GitHub Actions Overview:

- Built an automated CI/CD pipeline using GitHub Actions to build, test, scan, and deploy a Java web application.
- Integrated code quality and security scanning as part of the pipeline.

Tools Used:

- GitHub Actions – CI/CD automation
- SonarQube – Code quality analysis
- Snyk – Dependency and security vulnerability scanning
- Nexus Repository – Artifact management

- Apache Tomcat – Application deployment
- Git & GitHub – Version control

PROJECT – 3

Title: Secure Web Application Deployment using AWS Route 53

Technologies: AWS EC2, VPC, Public & Private Subnets, Route Tables, Internet Gateway, NAT Gateway, Route 53, ACM, HTTPS/SSL, WAF, ACL, RDS, Load Balancer, Auto Scaling, CloudWatch, IAM

- Architected and deployed a secure, scalable, and highly available web application on AWS, leveraging VPC networking with public and private subnets, NAT Gateway, Internet Gateway, and Route Tables to enforce strict network segmentation.
- Provisioned EC2 instances behind an Application Load Balancer with Auto Scaling to ensure fault tolerance and high availability across multiple Availability Zones.
- Configured AWS Route 53 for DNS-based traffic routing, enabling reliable and fault-tolerant application delivery with health check-based failover.
- Secured the application using AWS WAF and ACLs to protect against common web-layer threats, and enforced IAM roles and policies for least-privilege access across all AWS resources.
- Implemented HTTPS/SSL encryption using AWS Certificate Manager (ACM) for all data in transit, ensuring compliance with security standards and safeguarding sensitive user information.
- Integrated Amazon RDS for managed relational database services with private subnet isolation, ensuring data security and high availability.
- Monitored infrastructure health and performance metrics using AWS CloudWatch, enabling proactive issue detection and continuous uptime assurance.

PROJECT – 4

Title: Kubernetes & Terraform — Infrastructure Automation on AWS

- Provisioned AWS EC2 infrastructure using Terraform (IaC) — wrote .tf configuration files to automate VPC, subnet, security group, and instance creation, replacing manual console setup with repeatable, version-controlled deployments.
- Deployed and managed a containerized application on a Kubernetes (K8s) cluster; authored Deployment and Service manifests (YAML), configured Helm charts for packaging, and used kubectl to monitor pod health and rolling updates.

Some other projects:

- 3-tier architecture project
- Terraform-Based 3-Tier Architecture Project
- CI/CD Pipeline for Java Application Using GitHub Actions, SonarQube, Nexus & Apache Tomcat
- Automated CI/CD Deployment of Java Application Using GitHub Actions, Docker, Amazon ECR, and Amazon ECS
- CI/CD Pipeline with GitHub
- Route 53 Project

INTERNSHIPS & EXPERIENCE

Web Application Development Intern | Oceanapps Technologies | Nov 2024

Developed responsive and user-friendly web application components while collaborating with team members on frontend development tasks. Participated in testing, debugging, and issue resolution activities to improve application functionality and user experience.

Advanced Backend Technologies Intern | Oceanapps Technologies | Jul 2025

Assisted in backend application development through API integration and database management activities. Contributed to application optimization and performance improvements while collaborating with the development team to troubleshoot and resolve backend-related issues.

EDUCATIONAL QUALIFICATIONS

B.Tech

Electronics and Communication Engineering **72.25%**
